### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by Takanishi et al. (US 5,719,468).

Regarding claim 1, Takanashi discloses a lamp-reflector unit in figures 6 and 8 comprising: a reflector (42) with a neck (not labeled), a light emission window (43), a circularly symmetrical reflecting portion (42) arranged around an optical axis extending through the neck and perpendicular to the light emission window, which reflecting portion extends from the neck up to the light emission window; a lamp (21) comprising an end portion, a first filament (25), and a second filament (29), said first and second filaments being located one behind the other, axially on the optical axis such that the first filament is located closer to the neck than the second filament; a lamp cap (7) mounted to the neck and provided with electrical contacts (9) and with current conductors (11) connected to the latter and to the respective filaments, characterized in that the lamp is a modified, low-voltage, dual-filament halogen automobile lamp whose end portion is fixed in the neck of the reflector (for example, see Figs. 6 and 8).

Regarding claim 2, Takanashi teaches the lamp having a translucent wall comprising a first and (23) a second wall portion (27), which surround the first and the second filament, respectively, wherein at least one wall portion has a spectrally modifying effect on light originating from the filament and passing through the relevant wall portion (for example, see Fig. 6).

Art Unit: 2879

Regarding claim 3, Takanashi teaches at least one of the wall portions comprises a coating (12).

Regarding claim 4, Takanashi teaches the reflecting portion of the reflector being subdivided into facets (for example, see Fig. 6).
